

DESCRIPTION

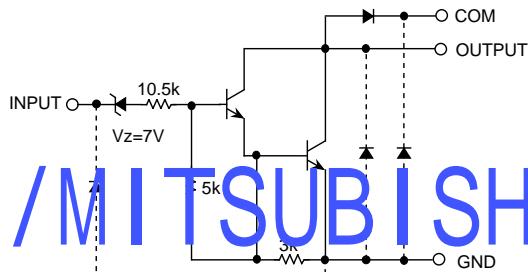

M54525AGP is seven-circuit Darlington transistor array with clamping diodes. The circuits are made of NPN transistors. Both the semiconductor integrated circuits perform high-current driving with extremely low input-current supply.

FEATURES

- High breakdown voltage ($BV_{CEO} \geq 50V$)
- High-current driving ($I_C(\max) = 500mA$)
- With clamping diodes
- Driving available with PMOS IC output of 24V
- Wide operating temperature range ($T_a = -40$ to $+85^{\circ}C$)

PIN CONFIGURATION

Package type 16P2S-A

FUNCTION

The M54525AGP has seven circuits consisting of NPN Darlington transistors. This IC has resistance of $10.5k\Omega$ and Zener diode between input transistor bases and input pins. A spike-killer clamping diode is provided between each output pin (collector) and COM pin (pin 9). The output transistor emitters are all connected to the GND pin (pin 8). The collector current is 500mA maximum. Collector-emitter supply voltage is 50V maximum. The M54525AGP is enclosed in molded small flat package, enabling space-saving design.
