MITSUBISHI SEMICONDUCTOR <TRANSISTOR ARRAY>

# M63832GP/KP

7-UNIT 500mA DARLINGTON TRANSISTOR-ARRAY

## DESCRIPTION

The M63832GP/KP 7-channel sinkdriver, consists of 7 PNP and 14 NPN transistors connected to form seven high current gain driver pairs.

## FEATURES

- High breakdown voltage ( $BV_{CEO} \geq 50V$ )
- High-current driving ( $I_C(max) = 500mA$ )
- 3V micro computer compatible input
- "L" active level input
- With input diode
- Wide operating temperature range ( $T_a = -40$  to  $+85^{\circ}C$ )

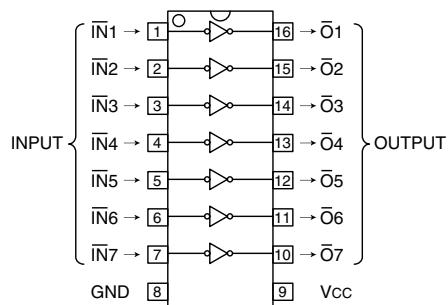

## APPLICATION

Output for 3 voltage microcomputer series and interface with high voltage system. Relay and small printer driver, LED, or incandescent display digit driver.

## FUNCTION

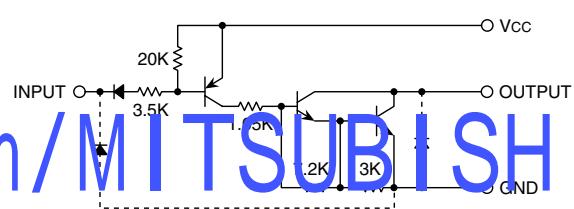

The M63832GP/KP is transistor-array of high active level seven units type which can direct drive of 3 voltage microcomputer series. A resistor of  $3.5k\Omega$  is connected between the input and the base of 1 NPN transistors. The input diode is intended to prevent the flow of current from the input to the Vcc. Without this diode, the current flows from "H" input to the Vcc and the "L" input circuit is activated, in such a case where one of the inputs of the 7 circuit is "H" and the other are "L" to save power consumption. The diode is inserted to prevent such mis-operation. The outputs are capable of driving 500mA and are rated for operation with output voltage up to 50V.

## PIN CONFIGURATION

16P2S-A(GP)  
Package type 16P2Z-A(KP)

## CIRCUIT DIAGRAM

The seven circuits share the Vcc and GND

The diode, indicated with the dotted line, is parasitic, and cannot be used.

Unit :  $\Omega$
