Mitsubishi Electric Corporation puts the maximum effort into making semiconductor products better and more reliable, but there is always the possibility that trouble may occur with them. Trouble with semiconductors may lead to personal injury, fire or property damage. Remember to give due consideration to safety when making your circuit designs, with appropriate measures such as (i)placement of substitutive, auxiliary, circuits, (ii)use of non-flammable material or (iii)prevention against any malfunction or mishap.

HANDLING PRECAUTION

- 1) Work desk, test equipment, soldering iron and worker should be grounded before mounting and testing. Please note that electric discharge of GaAs HBT is much more sensitive than that of Si transistor. Handling without ground possibly damages GaAs HBT.
- 2) The surface of a board on which this product is mounted should be as flat and clean as possible to prevent a substrate from cracking by bending this product.
- 3) IR reflow soldering condition is confirmed following profile.

- 4) Handling precaution at high temperature
This product has the structure of sealing with epoxy resin on glass epoxy substrate. This epoxy resin gets soft if the temperature exceeds glass transition temperature= 120 degC , and the thermic decomposition is occurred if the temperature exceeds 350 degC . Therefore, in case of heating this product, please keep the same heat profile as recommended reflow one.
Please note that crack, flaw or modification may be generated if softened epoxy resin part is handled with tweezers and etc at high temperature.
- 5) Cleaning condition
Please select after confirming administrative guidance, legal restrictions, and the mass of the residual ion contaminant etc., and use it.
- 6) After soldering, please remove the flux. Please take care that solvent does not penetrate into this product.
- 7) GaAs HBT contains As(Arsenic). This product should be dumped as particular industrial waste.
