RF2373

3.3V LOW NOISE AMPLIFIER/ 3V DRIVER AMPLIFIER

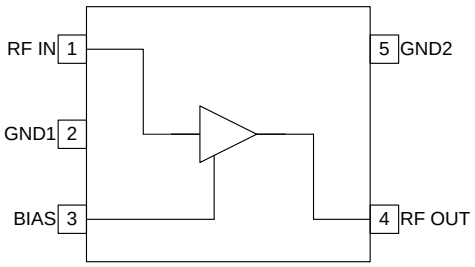
Package Style: SOT 5-Lead

Features

- Low Noise and High Intercept Point
- Adjustable Bias Current
- Power Down Control
- Single 2.7V to 5.0V Power Supply
- 0.4GHz to 4GHz Operation
- SOT 5-Lead Package

Applications

- WiFi LNA/Driver
- GPS LNA
- CDMA PCS LNA
- Low Noise Transmit Power Amplifier
- General Purpose Amplification
- Driver Amplifier for TX Power Amplifier



Functional Block Diagram

Product Description

The RF2373 is a low noise amplifier with a high dynamic range designed for WiFi, WiMAX, and digital cellular applications. The device functions as an outstanding front end low noise amplifier or driver amplifier in the transmit chain of digital subscriber units where low transmit noise power is a concern. When used as an LNA, the bias current can be set externally. When used as a PA driver, the IC can operate directly from a single cell Li-ion battery and includes a power down feature that can be used to completely turn off the device. The IC is featured in a standard SOT 5-lead plastic package.

Ordering Information

RF2373	Standard 25 piece bag
RF2373SR	Standard 100 piece reel
RF2373TR7	Standard 2500 piece reel
RF2373PCK-414	Fully Assembled Evaluation Board and 5 loose sample pieces

Absolute Maximum Ratings

Parameter	Rating	Unit
Supply Voltage	-0.5 to +6.0	V_{DC}
Bias Voltage, V_{BIAS}	$\leq V_{CC}$	V_{DC}
Input RF Level at F<2.3GHz	+5 (see note)	dBm
Input RF Level at F>2.3GHz	+10 (see note)	dBm
Current Drain, I_{CC}	32	mA
Operating Ambient Temperature	-40 to +85	°C
Storage Temperature	-40 to +150	°C

NOTE: Exceeding any one or a combination of the above maximum rating limits may cause permanent damage. Input RF transients to +15dBm will not harm the device. For sustained operation at inputs ≥+5dBm, a small dropping resistor is recommended in series with the V_{CC} in order to limit the current due to self-biasing to <32mA. Furthermore, while the LNA is in Bypass Mode, and for sustained operation at the input, +10dBm is the maximum recommended power level for Frequencies above 2300MHz. +5dBm is the maximum recommended power level for Frequencies <2300MHz.

Caution! ESD sensitive device.

Exceeding any one or a combination of the Absolute Maximum Rating conditions may cause permanent damage to the device. Extended application of Absolute Maximum Rating conditions to the device may reduce device reliability. Specified typical performance or functional operation of the device under Absolute Maximum Rating conditions is not implied.

RoHS status based on EUDirective2002/95/EC (at time of this document revision).

Parameter	Specification			Unit	Condition
	Min.	Typ.	Max.		
Overall					25°C, V_{CC}=3.3V, at typical frequencies unless otherwise specified

Pin	Function	Description	Interface Schematic
1	RF IN	RF input pin. This pin is DC coupled.	2	GND1	Ground connection. For best performance, keep traces physically short and connect immediately to ground plane.	
3	BIAS	This pin is used to control the bias current. An external resistor can be used to set the bias current for any V_{BIAS} voltage. See table with evaluation board schematic.	4	RF OUT	Amplifier output pin. This pin is an open-collector output. It must be biased to V_{CC} through a choke or matching inductor. This pin is typically matched to 50Ω with a shunt bias/matching inductor and series blocking/matching capacitor. Refer to application schematics.	
5	GND2	Ground connection. For best performance, keep traces physically short and connect immediately to ground plane.
