Revision History

Revision	Month	Year	History
1.0	November	2007	- Initial Release

184Pin Registered DIMM based on 256Mb J-die (x4)**1.0 Ordering Information**

Part Number	Density	Organization	Component Composition	Height
M312L6420JUS-CB0	512MB	64M x 72	64Mx4(K4H560438J) * 18EA	1,200mil

Note : "U" of Part number(11th digit) stand for Lead-free TSOP products.

Note : "S" of Part number(12th digit) stand for Reduced Layer PCB products.

2.0 Operating Frequencies

	B0(DDR266@CL=2.5)
Speed @CL2	100MHz
Speed @CL2.5	133MHz
Speed @CL3	-
CL-tRCD-tRP	2.5-3-3

3.0 Feature

- $V_{DD} : 2.5V \pm 0.2V$, $V_{DDQ} : 2.5V \pm 0.2V$ for DDR266
- Double-data-rate architecture; two data transfers per clock cycle
- Bidirectional data strobe [DQ] (x4,x8) & [L(U)DQS] (x16)
- Differential clock inputs(CK and \overline{CK})
- DLL aligns DQ and DQS transition with CK transition
- Programmable Read latency : DDR266(2, 2.5 Clock)
- Programmable Burst length (2, 4, 8)
- Programmable Burst type (sequential & interleave)
- Edge aligned data output, center aligned data input
- Auto & Self refresh, 7.8us refresh interval(8K/64ms refresh)
- Serial presence detect with EEPROM
- SSTL_2 Interface
- 66pin TSOP II package
- All of base components are Lead-Free, Halogen-Free, and RoHS compliant

512MB Registered DIMM

Note :

- * : These pins are not used in this module.
- Pins 111, 158 are NC for 1row module & used for 2row module.
- Pins 97, 107, 119, 129, 140, 149, 159, 169, 177 : DM (x8 base module) or DQS (x4 base module).

5.0 Pin Description

Pin Name	Function	Pin Name	Function
A0 ~ A12	Address input (Multiplexed)	DM0 ~ DM8	Data - in mask
BA0 ~ BA1A	Bank Select Address	V _{DD}	Power supply (2.5V for DDR266)
DQ0 ~ DQ63	Data input/output	V _{DDQ}	Power Supply for DQS (2.5V for DDR266)
DQS0 ~ DQS17	Data Strobe input/output	V _{SS}	Ground
CK0,CK0 ~ CK2, CK2	Clock input	V _{REF}	Power supply for reference
CKE0, CKE1(for double banks)	Clock enable input	V _{DDSPD}	Serial EEPROM Power/Supply (2.3V to 3.6V)
CS0, CS1(for double banks)	Chip select input	SDA	Serial data I/O
RAS	Row address strobe	SCL	Serial clock
CAS	Column address strobe	SA0 ~ 2	Address in EEPROM
WE	Write enable	V _{DDID}	V _{DD} , V _{DDQ} level detection
CB0 ~ CB7	Check bit(Data-in/data-out)	NC	No connection

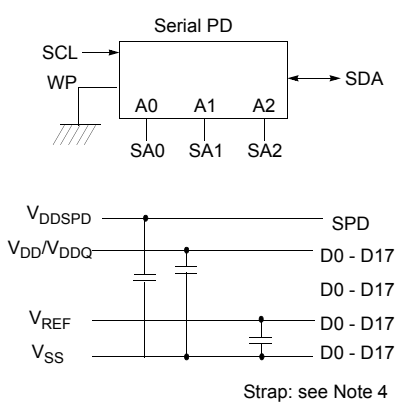

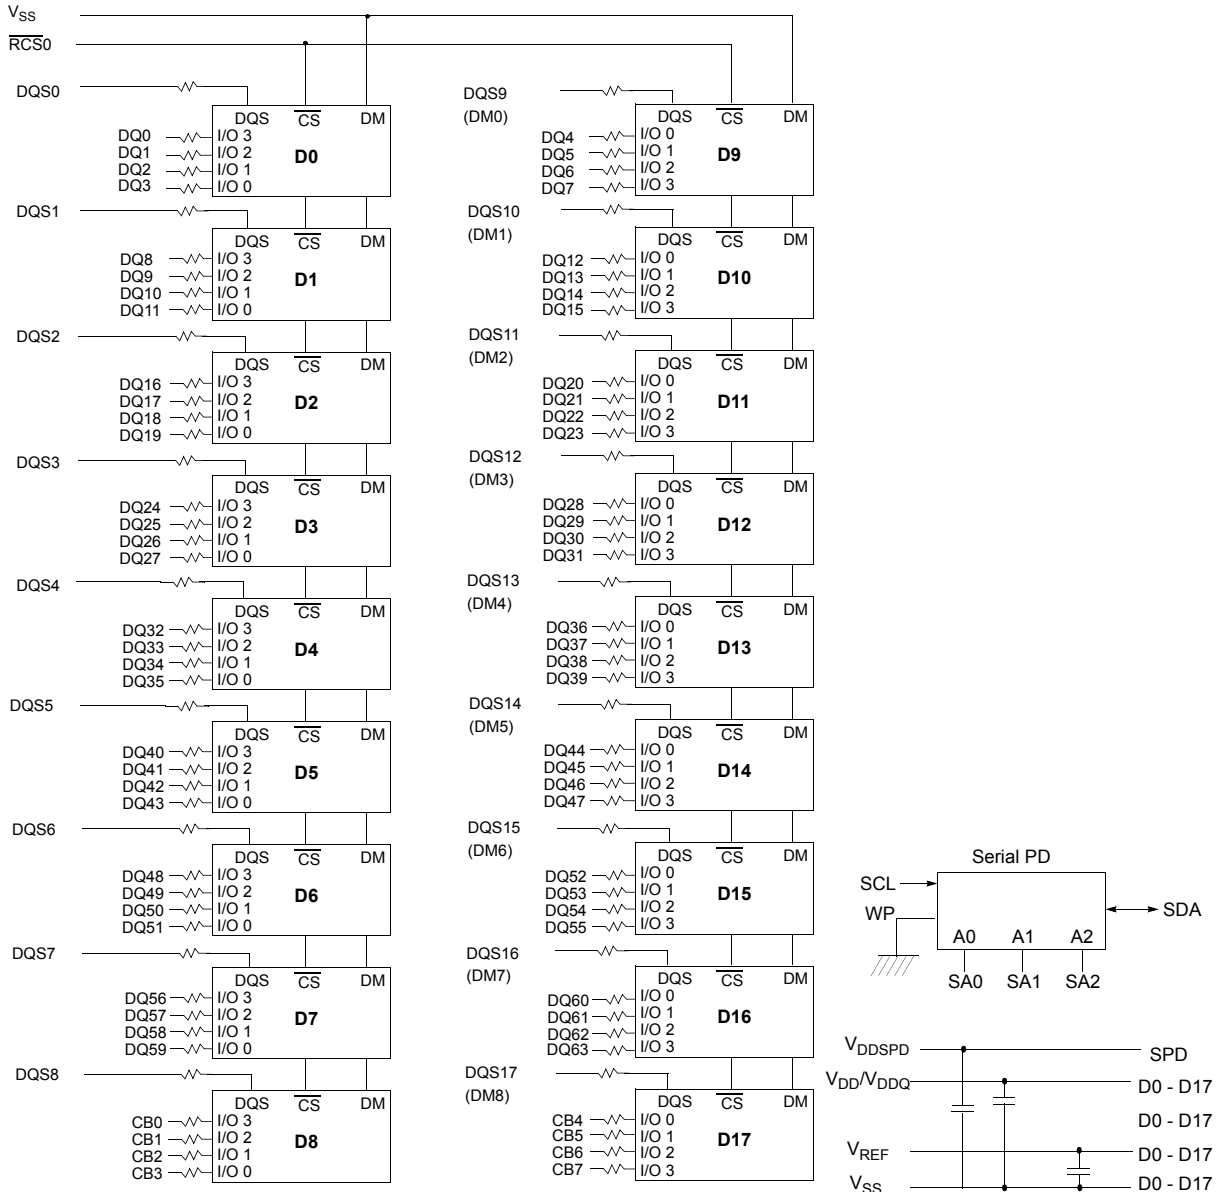

Note : V_{DDID} defines relationship of V_{DD} and V_{DDQ}, and the default status of it is open (V_{DD}=V_{DDQ})

512MB Registered DIMM

DDR SDRAM

6.0 512MB, 64M x 72 ECC Module (M312L6420JUS)

(Populated as 1 bank of x4 DDR SDRAM Module)

CK0, CK0 → PLL*
 * Wire per Clock Loading table/wiring Diagrams

- Notes:
1. DQ-to-I/O wiring is shown as recommended but may be changed.
 2. DQ/DQS/DM/CKE/S relationships must be maintained as shown.
 3. DQ, DQS, DM resistors: 22 Ohms.

7.0 Absolute Maximum Ratings

Parameter	Symbol	Value	Unit
Voltage on any pin relative to V_{SS}	V_{IN}, V_{OUT}	-0.5 ~ 3.6	V
Voltage on V_{DD} supply relative to V_{SS}	V_{DD}, V_{DDQ}	-1.0 ~ 3.6	V
Storage temperature	T_{STG}	-55 ~ +150	°C
Power dissipation	P_D	1.5 * # of component	W
Short circuit current	I_{OS}	50	mA

Note :
 Permanent device damage may occur if ABSOLUTE MAXIMUM RATINGS are exceeded.
 Functional operation should be restricted to recommended operating condition.
 Exposure to higher than recommended voltage for extended periods of time could affect device reliability.

8.0 Power & DC Operating Conditions (SSTL_2 In/Out)

Recommended operating conditions(Voltage referenced to $V_{SS}=0V$, $T_A=0$ to $70^{\circ}C$)

Parameter	Symbol	Min	Max	Unit	Note
Supply voltage(for device with a nominal V_{DD} of 2.5V for DDR266/333)	V_{DD}	2.3	2.7	V	
I/O Supply voltage(for device with a nominal V_{DD} of 2.5V for DDR266/333)	V_{DDQ}	2.3	2.7	V	
I/O Reference voltage	V_{REF}	$0.49 * V_{DDQ}$	$0.51 * V_{DDQ}$	V	1
I/O Termination voltage(system)	V_{TT}	$V_{REF}-0.04$	$V_{REF}+0.04$	V	2
Input logic high voltage	$V_{IH}(DC)$	$V_{REF}+0.15$	$V_{DDQ}+0.3$	V	
Input logic low voltage	$V_{IL}(DC)$	-0.3	$V_{REF}-0.15$	V	
Input Voltage Level, CK and \overline{CK} inputs	$V_{IN}(DC)$	-0.3	$V_{DDQ}+0.3$	V	
Input Differential Voltage, CK and \overline{CK} inputs	$V_{ID}(DC)$	0.36	$V_{DDQ}+0.6$	V	3
V-I Matching: Pullup to Pulldown Current Ratio	$V_I(\text{Ratio})$	0.71	1.4	-	4
Input leakage current	I_I	-2	2	uA	
Output leakage current	I_{OZ}	-5	5	uA	
Output High Current(Normal strength driver) ; $V_{OUT} = V_{TT} + 0.84V$	I_{OH}	-16.8		mA	
Output High Current(Normal strength driver) ; $V_{OUT} = V_{TT} - 0.84V$	I_{OL}	16.8		mA	
Output High Current(Half strength driver) ; $V_{OUT} = V_{TT} + 0.45V$	I_{OH}	-9		mA	
Output High Current(Half strength driver) ; $V_{OUT} = V_{TT} - 0.45V$	I_{OL}	9		mA	

Note :
 1. V_{REF} is expected to be equal to $0.5 * V_{DDQ}$ of the transmitting device, and to track variations in the dc level of same. Peak-to peak noise on V_{REF} may not exceed +/-2% of the dc value.
 2. V_{TT} is not applied directly to the device. V_{TT} is a system supply for signal termination resistors, is expected to be set equal to V_{REF} , and must track variations in the DC level of V_{REF} .
 3. V_{ID} is the magnitude of the difference between the input level on CK and the input level on \overline{CK} .
 4. The ratio of the pullup current to the pulldown current is specified for the same temperature and voltage, over the entire temperature and voltage range, for device drain to source voltages from 0.25V to 1.0V. For a given output, it represents the maximum difference between pullup and pulldown drivers due to process variation. The full variation in the ratio of the maximum to minimum pullup and pulldown current will not exceed 1.7 for device drain to source voltages from 0.1 to 1.0.

9.0 DDR SDRAM IDD spec table**9.1 M312L6420JUS [(64M x 4) * 18 , 512MB Module]**(V_{DD}=2.7V, T = 10°C)

Symbol	B0(DDR266@CL=2.5)	Unit	Notes
IDD0	1,975	mA	
IDD1	2,425	mA	
IDD2P	379	mA	
IDD2F	1,075	mA	
IDD2Q	739	mA	
IDD3P	955	mA	
IDD3N	1,435	mA	
IDD4R	3,415	mA	
IDD4W	3,415	mA	
IDD5	3,325	mA	
IDD6	Normal	379	mA
	Low power	352	mA
IDD7A	4,765	mA	

* Module IDD was calculated on the basis of component IDD and can be differently measured according to DQ loading cap.

10.0 AC Operating Conditions

Parameter/Condition	Symbol	Min	Max	Unit	Note
Input High (Logic 1) Voltage, DQ, DQS and DM signals	$V_{IH}(AC)$	$V_{REF} + 0.31$		V	
Input Low (Logic 0) Voltage, DQ, DQS and DM signals.	$V_{IL}(AC)$		$V_{REF} - 0.31$	V	
Input Differential Voltage, CK and \overline{CK} inputs	$V_{ID}(AC)$	0.7	$V_{DDQ} + 0.6$	V	1
Input Crossing Point Voltage, CK and \overline{CK} inputs	$V_{IX}(AC)$	$0.5 \cdot V_{DDQ} - 0.2$	$0.5 \cdot V_{DDQ} + 0.2$	V	2

- Note :
- V_{ID} is the magnitude of the difference between the input level on CK and the input on \overline{CK} .
 - The value of V_{IX} is expected to equal $0.5 \cdot V_{DDQ}$ of the transmitting device and must track variations in the DC level of the same.

Output Load Circuit (SSTL_2)

11.0 Input/Output Capacitance

($T_A = 25^\circ C, f = 100 MHz$)

Parameter	Symbol	M312L6420JUS		Unit
		Min	Max	
Input capacitance(A0 ~ A12, BA0 ~ BA1, RAS, CAS, WE)	CIN1	9	11	pF
Input capacitance(CKE0)	CIN2	9	11	pF
Input capacitance(CS0)	CIN3	9	11	pF
Input capacitance(CLK0, $\overline{CLK0}$)	CIN4	11	12	pF
Input capacitance(DM0~DM8)	CIN5	10	11	pF
Data & DQS input/output capacitance(DQ0~DQ63)	Cout1	10	11	pF
Data input/output capacitance (CB0~CB7)	Cout2	10	11	pF

12.0 AC Timing Parameters & Specifications

Autoprecharge write recovery + Precharge time	tDAL	(tWR/tCK) + (tRP/tCK)		tCK	23

13.0 System Characteristics for DDR SDRAM

The following specification parameters are required in systems using DDR266 devices to ensure proper system performance. these characteristics are for system simulation purposes and are guaranteed by design.

Table 1 : Input Slew Rate for DQ, DQS, and DM

AC CHARACTERISTICS PARAMETER	SYMBOL	DDR266		Units	Notes
		MIN	MAX		
DQ/DM/DQS input slew rate measured between $V_{IH}(DC)$, $V_{IL}(DC)$ and $V_{IL}(DC)$, $V_{IH}(DC)$	DCSLEW	0.5	4.0	V/ns	a, l

Table 2 : Input Setup & Hold Time Derating for Slew Rate

Input Slew Rate	Δt_{IS}	Δt_{IH}	Units	Notes
0.5 V/ns	0	0	ps	i
0.4 V/ns	+50	0	ps	i
0.3 V/ns	+100	0	ps	i

Table 3 : Input/Output Setup & Hold Time Derating for Slew Rate

Input Slew Rate	Δt_{DS}	Δt_{DH}	Units	Notes
0.5 V/ns	0	0	ps	k
0.4 V/ns	+75	+75	ps	k
0.3 V/ns	+150	+150	ps	k

Table 4 : Input/Output Setup & Hold Derating for Rise/Fall Delta Slew Rate

Delta Slew Rate	Δt_{DS}	Δt_{DH}	Units	Notes
+/- 0.0 V/ns	0	0	ps	j
+/- 0.25 V/ns	+50	+50	ps	j
+/- 0.5 V/ns	+100	+100	ps	j

Table 5 : Output Slew Rate Characteristic (X4, X8 Devices only)

Slew Rate Characteristic	Typical Range (V/ns)	Minimum (V/ns)	Maximum (V/ns)	Notes
Pullup Slew Rate	1.2 ~ 2.5	1.0	4.5	a,c,d,f,g,h
Pulldown slew	1.2 ~ 2.5	1.0	4.5	b,c,d,f,g,h

Table 6 : Output Slew Rate Characteristic (X16 Devices only)

Slew Rate Characteristic	Typical Range (V/ns)	Minimum (V/ns)	Maximum (V/ns)	Notes
Pullup Slew Rate	1.2 ~ 2.5	0.7	5.0	a,c,d,f,g,h
Pulldown slew	1.2 ~ 2.5	0.7	5.0	b,c,d,f,g,h

Table 7 : Output Slew Rate Matching Ratio Characteristics

AC CHARACTERISTICS PARAMETER	DDR266		Notes
	MIN	MAX	
Output Slew Rate Matching Ratio (Pullup to Pulldown)	0.67	1.5	e, l

14.0 Component Notes

1. All voltages referenced to V_{SS} .
2. Tests for ac timing, I_{DD} , and electrical, ac and dc characteristics, may be conducted at nominal reference/supply voltage levels, but the related specifications and device operation are guaranteed for the full voltage range specified.
3. Figure 1 represents the timing reference load used in defining the relevant timing parameters of the part. It is not intended to be either a precise representation of the typical system environment nor a depiction of the actual load presented by a production tester. System designers will use IBIS or other simulation tools to correlate the timing reference load to a system environment. Manufacturers will correlate to their production test conditions (generally a coaxial transmission line terminated at the tester electronics).

Figure 1 : Timing Reference Load

4. AC timing and I_{DD} tests may use a V_{IL} to V_{IH} swing of up to 1.5 V in the test environment, but input timing is still referenced to V_{REF} (or to the crossing point for CK/\overline{CK}), and parameter specifications are guaranteed for the specified ac input levels under normal use conditions. The minimum slew rate for the input signals is 1 V/ns in the range between $V_{IL}(AC)$ and $V_{IH}(AC)$.
5. The ac and dc input level specifications are as defined in the SSTL_2 Standard (i.e., the receiver will effectively switch as a result of the signal crossing the ac input level and will remain in that state as long as the signal does not ring back above (below) the dc input LOW (HIGH) level.
6. Inputs are not recognized as valid until V_{REF} stabilizes. Exception: during the period before V_{REF} stabilizes, $CKE \leq 0.2V_{DDQ}$ is recognized as LOW.
7. Enables on-chip refresh and address counters.
8. I_{DD} specifications are tested after the device is properly initialized.
9. The CK/\overline{CK} input reference level (for timing referenced to CK/\overline{CK}) is the point at which CK and \overline{CK} cross; the input reference level for signals other than CK/\overline{CK} , is V_{REF} .
10. The output timing reference voltage level is V_{TT} .
11. tHZ and tLZ transitions occur in the same access time windows as valid data transitions. These parameters are not referenced to a specific voltage level but specify when the device output is no longer driving (HZ), or begins driving (LZ).
12. The maximum limit for this parameter is not a device limit. The device will operate with a greater value for this parameter, but system performance (bus turnaround) will degrade accordingly.
13. The specific requirement is that DQS be valid (HIGH, LOW, or at some point on a valid transition) on or before this CK edge. A valid transition is defined as monotonic and meeting the input slew rate specifications of the device. when no writes were previously in progress on the bus, DQS will be transitioning from High-Z to logic LOW. If a previous write was in progress, DQS could be HIGH, LOW, or transitioning from HIGH to LOW at this time, depending on tDQSS.
14. A maximum of eight AUTO REFRESH commands can be posted to any given DDR SDRAM device.
15. For command/address input slew rate ≥ 1.0 V/ns
16. For command/address input slew rate ≥ 0.5 V/ns and < 1.0 V/ns
17. For CK & \overline{CK} slew rate ≥ 1.0 V/ns
18. These parameters guarantee device timing, but they are not necessarily tested on each device. They may be guaranteed by device design or tester correlation.
19. Slew Rate is measured between $V_{OH}(AC)$ and $V_{OL}(AC)$.
20. Min (tCL, tCH) refers to the smaller of the actual clock low time and the actual clock high time as provided to the device (i.e. this value can be greater than the minimum specification limits for tCL and tCH)....For example, tCL and tCH are = 50% of the period, less the half period jitter (tJIT(HP)) of the clock source, and less the half period jitter due to crosstalk (tJIT(crosstalk)) into the clock traces.
21. $t_{QH} = t_{HP} - t_{QHS}$, where:
 tHP = minimum half clock period for any given cycle and is defined by clock high or clock low (tCH, tCL). tQHS accounts for 1) The pulse duration distortion of on-chip clock circuits; and 2) The worst case push-out of DQS on one transition followed by the worst case pull-in of DQ on the next transition, both of which are, separately, due to data pin skew and output pattern effects, and p channel to n-channel variation of the output drivers.
22. tDQSQ - Consists of data pin skew and output pattern effects, and p-channel to n-channel variation of the output drivers for any given cycle.
23. $t_{DAL} = (t_{WR}/t_{CK}) + (t_{TRP}/t_{CK})$
 For each of the terms above, if not already an integer, round to the next highest integer. Example: For DDR266B at CL=2.5 and tCK=7.5ns $t_{DAL} = (15 \text{ ns} / 7.5 \text{ ns}) + (20 \text{ ns} / 7.5 \text{ ns}) = (2) + (3) t_{DAL} = 5$ clocks

15.0 System Notes:

a. Pullup slew rate is characterized under the test conditions as shown in Figure 2.

Figure 2 : Pullup slew rate test load

b. Pulldown slew rate is measured under the test conditions shown in Figure 3.

Figure 3 : Pulldown slew rate test load

c. Pullup slew rate is measured between ($V_{DDQ}/2 - 320 \text{ mV} \pm 250 \text{ mV}$)

Pulldown slew rate is measured between ($V_{DDQ}/2 + 320 \text{ mV} \pm 250 \text{ mV}$)

Pullup and Pulldown slew rate conditions are to be met for any pattern of data, including all outputs switching and only one output switching.

Example : For typical slew rate, DQ0 is switching

For minimum slew rate, all DQ bits are switching from either high to low, or low to high.

The remaining DQ bits remain the same as for previous state.

d. Evaluation conditions

Typical : 25 °C (T Ambient), $V_{DDQ} = 2.5\text{V}$ (for DDR266/333) and 2.6V(for DDR400), typical process

Minimum : 70 °C (T Ambient), $V_{DDQ} = 2.3\text{V}$ (for DDR266/333) and 2.5V(for DDR400), slow - slow process

Maximum : 0 °C (T Ambient), $V_{DDQ} = 2.7\text{V}$ (for DDR266/333) and 2.7V(for DDR400), fast - fast process

e. The ratio of pullup slew rate to pulldown slew rate is specified for the same temperature and voltage, over the entire temperature and voltage range. For a given output, it represents the maximum difference between pullup and pulldown drivers due to process variation.

f. Verified under typical conditions for qualification purposes.

g. TSOP11 package devices only.

h. Only intended for operation up to 266 Mbps per pin.

i. A derating factor will be used to increase tIS and tIH in the case where the input slew rate is below 0.5V/ns as shown in Table 2. The Input slew rate is based on the lesser of the slew rates determined by either $V_{IH}(AC)$ to $V_{IL}(AC)$ or $V_{IH}(DC)$ to $V_{IL}(DC)$, similarly for rising transitions.

j. A derating factor will be used to increase tDS and tDH in the case where DQ, DM, and DQS slew rates differ, as shown in Tables 3 & 4. Input slew rate is based on the larger of AC-AC delta rise, fall rate and DC-DC delta rise, Input slew rate is based on the lesser of the slew rates determined by either $V_{IH}(AC)$ to $V_{IL}(AC)$ or $V_{IH}(DC)$ to $V_{IL}(DC)$, similarly for rising transitions. The delta rise/fall rate is calculated as: $\{1/(\text{Slew Rate1})\} - \{1/(\text{Slew Rate2})\}$

For example : If Slew Rate 1 is 0.5 V/ns and slew Rate 2 is 0.4 V/ns, then the delta rise, fall rate is - 0.5ns/V . Using the table given, this would result in the need for an increase in tDS and tDH of 100 ps.

k. Table 3 is used to increase tDS and tDH in the case where the I/O slew rate is below 0.5 V/ns. The I/O slew rate is based on the lesser on the lesser of the AC - AC slew rate and the DC- DC slew rate. The input slew rate is based on the lesser of the slew rates determined by either $V_{IH}(AC)$ to $V_{IL}(AC)$ or $V_{IH}(DC)$ to $V_{IL}(DC)$, and similarly for rising transitions.

l. DQS, DM, and DQ input slew rate is specified to prevent double clocking of data and preserve setup and hold times. Signal transitions through the DC region must be monotonic.

m. In case of Registered DIMM, device operation defines Power up and Power Management.

184-pin Double Data Rate (DDR) Registered DIMMs include two new features to facilitate controlled power-up and to minimize power consumption during low power mode. One feature is externally controlled via a system-generated RESET signal; the second is based on module detection of the input clocks. These enhancements permit the modules to power up with SDRAM outputs in a High-Z state (eliminating risk of high current dissipations and/or dotted I/Os), and result in the powering-down of module support devices (registers and Phase-Locked Loop) when the memory is in Self-Refresh mode. device operation describes this more detailly.

16.0 Command Truth Table

(V=Valid, X=Don't Care, H=Logic High, L=Logic Low)

COMMAND		CKEn-1	CKEn	CS	RAS	CAS	WE	BA0,1	A10/AP	A0 ~ A9 A11, A12	Note	
Register	Extended MRS	H	X	L	L	L	L	OP CODE			1, 2	
Register	Mode Register Set	H	X	L	L	L	L	OP CODE			1, 2	
Refresh	Auto Refresh		H	H	L	L	L	H	X		3	
	Self Refresh	Entry		L					X		3	
		Exit	L	H	L	H	H	H	X		3	
	H				X	X	X	X		3		
Bank Active & Row Addr.		H	X	L	L	H	H	V	Row Address (A0~A9, A11,A12)			
Read & Column Address	Auto Precharge Disable		H	X	L	H	L	H	V	L	Column Address	4
	Auto Precharge Enable								H	4		
Write & Column Address	Auto Precharge Disable		H	X	L	H	L	L	V	L	Column Address	4
	Auto Precharge Enable									H		4, 6
Burst Stop		H	X	L	H	H	L	X			7	
Precharge	Bank Selection		H	X	L	L	H	L	V	L	X	
	All Banks								X	H		5
Active Power Down		Entry	H	L	H	X	X	X	X			
					L	V	V	V				
Precharge Power Down Mode		Entry	H	L	H	X	X	X	X			
					L	H	H	H				
		Exit	L	H	H	X	X	X				
					L	V	V	V				
DM		H	X					X			8	
No operation (NOP) : Not defined		H	X	H	X	X	X	X			9	
				L	H	H	H				9	

Note :

- OP Code : Operand Code. A0 ~ A12 & BA0 ~ BA1 : Program keys. (@EMRS/MRS)
- EMRS/ MRS can be issued only at all banks precharge state. A new command can be issued 2 clock cycles after EMRS or MRS.
- Auto refresh functions are same as the CBR refresh of DRAM.
The automatical precharge without row precharge command is meant by "Auto".
Auto/self refresh can be issued only at all banks precharge state.
- BA0 ~ BA1 : Bank select addresses.
If both BA0 and BA1 are "Low" at read, write, row active and precharge, bank A is selected.
If BA0 is "High" and BA1 is "Low" at read, write, row active and precharge, bank B is selected.
If BA0 is "Low" and BA1 is "High" at read, write, row active and precharge, bank C is selected.
If both BA0 and BA1 are "High" at read, write, row active and precharge, bank D is selected.
- If A10/AP is "High" at row precharge, BA0 and BA1 are ignored and all banks are selected.
- During burst write with auto precharge, new read/write command can not be issued.
Another bank read/write command can be issued after the end of burst.
New row active of the associated bank can be issued at tRP after the end of burst.
- Burst stop command is valid at every burst length.
- DM sampled at the rising and falling edges of the DQS and Data-in are masked at the both edges (Write DM latency is 0).
- This combination is not defined for any function, which means "No Operation(NOP)" in DDR SDRAM.

17.0 Physical Dimensions

17.1 64Mx72 (M312L6420JUS)

Units : Inches (Millimeters)

Tolerances : ± 0.005(.13) unless otherwise specified
 The used device is 64Mx4 DDRSDRAM, TSOPII
 DDR SDRAM Part No. : K4H560438J
