32Mx64 SDRAM SODIMM based on 16Mx8, 4Banks, 4K Refresh, 3.3V Synchronous DRAMs with SPD

**GENERAL DESCRIPTION**

The Samsung M464S3323DN1 is a 32M bit x 64 Synchronous Dynamic RAM high density memory module. The Samsung M464S3323DN1 consists of sixteen CMOS 16M x 8 bit with 4banks Synchronous DRAMs in sTSP2 package and a 2K EEPROM in 8-pin TSSOP package on a 144-pin glass-epoxy substrate. Two 0.1uF decoupling capacitors are mounted on the printed circuit board in parallel for each SDRAM.

The M464S3323DN1 is a Small Outline Dual In-line Memory Module and is intended for mounting into 144-pin edge connector sockets.

Synchronous design allows precise cycle control with the use of system clock. I/O transactions are possible on every clock cycle. Range of operating frequencies, programmable latencies allows the same device to be useful for a variety of high bandwidth, high performance memory system applications.

DQM0 ~ 7	<i>Data input/output mask</i>	Makes data output Hi-Z, tshz after the clock and masks the output. Blocks data input when DQM active. (Byte masking)
DQ0 ~ 63	<i>Data input/output</i>	Data inputs/outputs are multiplexed on the same pins.
V <sub>DD</sub> /V <sub>SS</sub>	<i>Power supply/ground</i>	Power and ground for the input buffers and the core logic.

- Notes :**
- The minimum number of clock cycles is determined by dividing the minimum time required with clock cycle time and then rounding off to the next higher integer.
  - Minimum delay is required to complete write.
  - All parts allow every cycle column address change.
  - In case of row precharge interrupt, auto precharge and read burst stop.
  - In 100MHz and below 100MHz operating conditions,  $t_{RD}=1CLK$  and  $t_{DAL}=1CLK + 20ns$  is also supported. SAMSUNG recommends  $t_{RD}=2CLK$  and  $t_{DAL}=2CLK + t_{RP}$ .

- Notes :**
- Parameters depend on programmed CAS latency.
  - If clock rising time is longer than 1ns,  $(tr/2-0.5)ns$  should be added to the parameter.
  - Assumed input rise and fall time ( $tr$  &  $tf$ ) = 1ns.  
If  $tr$  &  $tf$  is longer than 1ns, transient time compensation should be considered, i.e.,  $[(tr + tf)/2-1]ns$  should be added to the parameter.

**Notes :** 1. OP Code : Operand codeA<sub>0</sub> ~ A<sub>11</sub> & BA<sub>0</sub> ~ BA<sub>1</sub> : Program keys. (@ MRS)

2. MRS can be issued only at all banks precharge state.

A new command can be issued after 2 clock cycles of MRS.

3. Auto refresh functions are as same as CBR refresh of DRAM.

The automatical precharge without row precharge command is meant by "Auto".

Auto/self refresh can be issued only at all banks precharge state.

4. BA<sub>0</sub> ~ BA<sub>1</sub> : Bank select addresses.If both BA<sub>0</sub> and BA<sub>1</sub> are "Low" at read, write, row active and precharge, bank A is selected.If both BA<sub>0</sub> is "Low" and BA<sub>1</sub> is "High" at read, write, row active and precharge, bank B is selected.If both BA<sub>0</sub> is "High" and BA<sub>1</sub> is "Low" at read, write, row active and precharge, bank C is selected.If both BA<sub>0</sub> and BA<sub>1</sub> are "High" at read, write, row active and precharge, bank D is selected.If A<sub>10/AP</sub> is "High" at row precharge, BA<sub>0</sub> and BA<sub>1</sub> is ignored and all banks are selected.

5. During burst read or write with auto precharge, new read/write command can not be issued.

Another bank read/write command can be issued after the end of burst.

New row active of the associated bank can be issued at t<sub>RP</sub> after the end of burst.

6. Burst stop command is valid at every burst length.

7. DQM sampled at positive going edge of a CLK and masks the data-in at the very CLK (Write DQM latency is 0), but makes Hi-Z state the data-out of 2 CLK cycles after. (Read DQM latency is 2)
