GENERAL DESCRIPTION

The Samsung M53631601BE0/BJ0-C is a 16Mx36bits Dynamic RAM high density memory module. The Samsung M53631601BE0/BJ0-C consists of eight CMOS 16Mx4bits DRAMs and four CMOS 16Mx1bit DRAMs in SOJ packages mounted on a 72-pin glass-epoxy substrate. A 0.1 or 0.22uF decoupling capacitor is mounted on the printed circuit board for each DRAM. The M53631601BE0/BJ0-C is a Single In-line Memory Module with edge connections and is intended for mounting into 72 pin edge connector sockets.

NOTES

1. An initial pause of 200us is required after power-up followed by any 8 RAS-only or \overline{CAS} -before-RAS refresh cycles before proper device operation is achieved.
2. Input voltage levels are Vih/Vil. VIH(min) and VIL(max) are reference levels for measuring timing of input signals. Transition times are measured between VIH(min) and VIL(max) and are assumed to be 5ns for all inputs.
3. Measured with a load equivalent to 2 TTL loads and 100pF.
4. Operation within the tRCD(max) limit insures that tRAC(max) can be met. tRCD(max) is specified as a reference point only. If tRCD is greater than the specified tRCD(max) limit, then access time is controlled exclusively by tCAC.
5. Assumes that tRCD≥tRCD(max).
6. This parameter defines the time at which the output achieves the open circuit and is not referenced for VOH or VOL.
7. twcs is non-restrictive operating parameter. It is included in the data sheet as electrical characteristics only. If twcs≥twcs(min), the cycle is an early write cycle and the data out pin will remain high impedance for the duration of the cycle.
8. Either tRCH or tRRH must be satisfied for a read cycle.
9. These parameters are referenced to the \overline{CAS} leading edge in early write cycles.
10. Operation within the tRAD(max) limit insures that tRAC(max) can be met. tRAD(max) is specified as reference point only. If tRAD is greater than the specified tRAD(max) limit access time is controlled by tAA.
11. tASC≥6ns, Assume tT=2.0ns.
12. If \overline{RAS} goes high before \overline{CAS} high going, the open circuit condition of the output is achieved by CAS high going. If CAS goes high before RAS high going, the open circuit condition of the output is achieved by RAS going.
