

TOSHIBA BiCD Integrated Circuit Silicon Monolithic

# TB6560AHQ, TB6560AFG

## PWM Chopper-Type Bipolar Driver IC for Stepping Motor Control

The TB6560AHQ/AFG is a PWM chopper-type stepping motor driver IC designed for sinusoidal-input microstep control of bipolar stepping motors. The TB6560AHQ/AFG can be used in applications that require 2-phase, 1-2-phase, 2W1-2-phase and 4W1-2-phase excitation modes. The TB6560AHQ/AFG is capable of low-vibration, high-performance forward and reverse driving of a two-phase bipolar stepping motor using only a clock signal.

### Features

- Single-chip motor driver for sinusoidal microstep control of stepping motors
- High output withstand voltage due to the use of BiCD process:  $R_{on}$  (upper and lower sum) = 0.6  $\Omega$  (typ.)
- Forward and reverse rotation
- Selectable phase excitation modes (2, 1-2, 2W1-2 and 4W1-2)
- High output withstand voltage:  $V_{DSS}$  = 40 V
- High output current:  $I_{OUT}$  = AHQ: 3.5 A (peak)  
AFG: 2.5 A (peak)
- Packages: HZIP25-P-1.27/HQFP64-P-1010-0.50
- Internal pull-down resistors on inputs: 100 k $\Omega$  (typ.)
- Output monitor pin:  $I_{MO}$  current ( $I_{MO}$  (max) = 1 mA)
- Reset and enable pins
- Thermal shutdown (TSD)

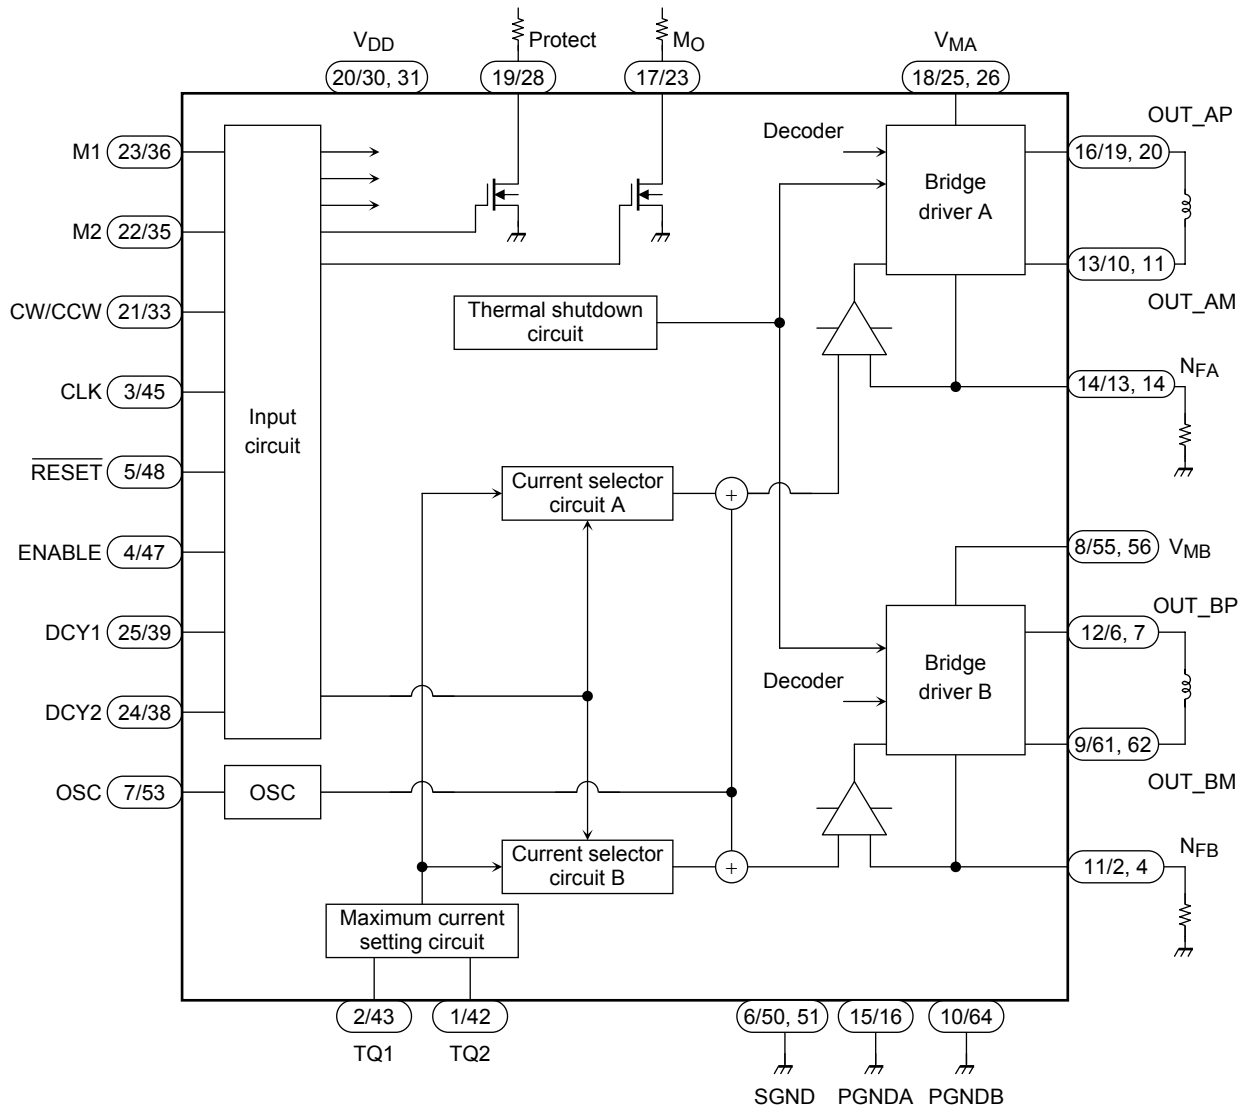

Weight:  
 HZIP25-P-1.27: 9.86 g (typ.)  
 HQFP64-P-1010-0.50: 0.26 g (typ.)

The TB6560AFG is RoHS compatible.  
 The TB6560AHQ is a Sn-plated product. (The Pb-containing materials with a high melting point that are exempted from RoHS directives are used inside the IC.)  
 The following conditions apply to solderability:  
 \*Solderability

1. Use of Sn-37Pb solder bath
  - \*solder bath temperature = 230°C
  - \*dipping time = 5 seconds
  - \*number of times = once
  - \*use of R-type flux
2. Use of Sn-3.0Ag-0.5Cu solder bath
  - \*solder bath temperature = 245°C
  - \*dipping time = 5 seconds
  - \*the number of times = once

\*: These ICs are highly sensitive to electrostatic discharge. When handling them, ensure that the environment is protected against electrostatic discharge. Ensure also that the ambient temperature and relative humidity are maintained at reasonable level.

## Pin Functions

Pin No.		I/O	Symbol	Functional Description	Remarks
AHQ	AFG				
1	42	Input	TQ2	Torque setting input (current setting)	Internal pull-down resistor
2	43	Input	TQ1	Torque setting input (current setting)	Internal pull-down resistor
3	45	Input	CLK	Clock input for microstepping	Internal pull-down resistor
4	47	Input	ENABLE	H: Enable; L: All outputs OFF	Internal pull-down resistor
5	48	Input	$\overline{\text{RESET}}$	L: Reset (The outputs are reset to their initial states.)	Internal pull-down resistor
6	50/51	—	SGND	Signal ground (for control block)	(Note 1)
7	53	—	OSC	A CR oscillation circuit is connected to this pin. Performs output chopping.	
8	55/56	Input	V <sub>MB</sub>	Motor power supply pin (for phase-B driver)	(Note 1)
9	61/62	Output	OUT <sub>BM</sub>	OUT <sub>B</sub> output	(Note 1)
10	64 (*)	—	PGNDB	Power ground	
11	2/4 (*)	—	N <sub>FB</sub>	Connection pin for a B-channel current sensing resistor Two pins of the TB6560AFG should be short-circuited.	(Note 1)
12	6/7	Output	OUT <sub>BP</sub>	OUT <sub>B</sub> output	(Note 1)
13	10/11	Output	OUT <sub>AM</sub>	OUT <sub>A</sub> output	(Note 1)
14	13/14 (*)	—	N <sub>FA</sub>	Connection pin for a A-channel current sensing resistor Two pins of the TB6560AFG should be short-circuited.	(Note 1)
15	16	—	PGNDA	Power ground	
16	19/20	Output	OUT <sub>AP</sub>	OUT <sub>A</sub> output	(Note 1)
17	23	Output	M <sub>O</sub>	Initial state sensing output. This pin is enabled in the initial state.	Open drain
18	25/26	Input	V <sub>MA</sub>	Motor power supply pin (for phase-A driver)	(Note 1)
19	28	Output	Protect	When TSD is activated: High; when in normal state: High-Z.	Open drain
20	30/31	Input	V <sub>DD</sub>	Power supply pin for control block	(Note 1)
21	33	Input	CW/CCW	Rotation direction select input. L: Clockwise; H: Counterclockwise	Internal pull-down resistor
22	35	Input	M2	Excitation mode setting input	Internal pull-down resistor
23	36	Input	M1	Excitation mode setting input	Internal pull-down resistor
24	38	Input	DCY2	Current decay mode setting input	Internal pull-down resistor
25	39	Input	DCY1	Current decay mode setting input	Internal pull-down resistor

(\*) : The pin assignment of the TB6560AFG is different from that of the TB6560FG.

TB6560AHQ: There is no no-connect (NC) pin.

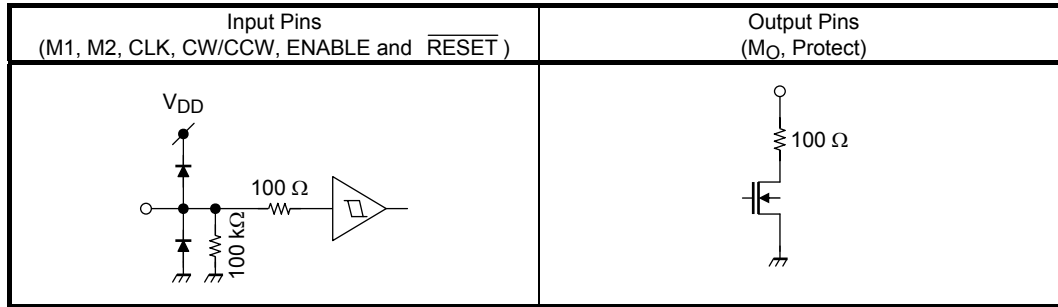

TB6560AFG: Except the above pins, all pins are NC. The pin numbers of NC pins are: 1, 3, 5, 8, 9, 12, 15, 17, 18, 21, 22, 24, 27, 29, 32, 34, 37, 40, 41, 44, 46, 49, 52, 54, 57, 58, 59, 60, and 63.

Applying a voltage to NC pins does not cause any problem since they are not connected inside the IC.

All control input pins have an internal pull-down resistor of 100 k $\Omega$  (typ.)

Note 1: As for the TB6560AFG, two pins that have the same functionality should be short-circuited at a location as close to the TB6560AFG as possible.

(The electrical characteristics provided in this document are measured when those pins are handled in this manner.)

**Functional Descriptions**

**1. Excitation Mode Settings**

The excitation mode can be selected from the following four modes using the M1 and M2 inputs. (The 2-phase excitation mode is selected by default since both M1 and M2 have internal pull-down resistors.)

Inputs		Mode (Excitation)
M2	M1	
L	L	2-phase
L	H	1-2-phase
H	L	4W1-2-phase
H	H	2W1-2-phase

**2. Function Table (Relationship Between Inputs and Output Modes)**

When the ENABLE pin is Low, outputs are off. When the  $\overline{\text{RESET}}$  pin is Low, the outputs are put in the Initial mode as shown in the table below. In this mode, the states of the CLK and CW/CCW pins are don't-cares.

Inputs				Output Mode
CLK	CW/CCW	$\overline{\text{RESET}}$	ENABLE	
$\uparrow$	L	H	H	CW
$\uparrow$	H	H	H	CCW
X	X	L	H	Initial mode
X	X	X	L	Z

X: Don't care

**3. Initial Mode**

When  $\overline{\text{RESET}}$  is asserted, phase currents in each excitation mode are as follows. At this time, the M0 pin goes Low (open-drain connection).

Excitation Mode	A-Phase Current	B-Phase Current
2-phase	100%	-100%
1-2-phase	100%	0%
W1-2-phase	100%	0%
2W1-2-phase	100%	0%

**4. Decay Mode Settings**

It takes approximately four OSC cycles for discharging a current in PWM mode. The 25% decay mode is created by inducing decay during the last cycle in Fast Decay mode; the 50% Decay mode is created by inducing decay during the last two cycles in Fast Decay mode; and the 100% Decay mode is created by inducing decay during all four cycles in Fast Decay mode.

Since the DCY1 and DCY2 pins have internal pull-down resistors, the Normal mode is selected when DCY1 and DCY2 are undriven.

DCY2	DCY1	Current Decay Setting
L	L	Normal 0%
L	H	25% Decay
H	L	50% Decay
H	H	100% Decay

**5. Torque Settings (Current Value)**

The ratio of the current necessary for actual operations to the predefined current adjusted by an external resistor can be selected as follows. The Weak Excitation mode should be selected to set a torque extremely low like when the motor is at a fixed position.

Since the TQ2 and TQ1 pins have pull-down resistors, the 100% torque setting is selected when TQ2 and TQ1 are undriven.

TQ2	TQ1	Current Ratio
L	L	100%
L	H	75%
H	L	50%
H	H	20% (Weak excitation)

**6. Calculation of the Predefined Output Current**

To perform a constant current drive, the reference current should be adjusted by an external resistor. A charging stops when the N<sub>FA</sub> (N<sub>FB</sub>) voltage reaches 0.5 V (when the torque setting is 100%) so that a current does not exceed the predefined level.

$$I_{OUT} (A) = 0.5 (V) / R_{NF} (\Omega)$$

Example: To set the peak current to 1 A, the value of an external resistor should be 0.5 Ω.

**7. Protect and M<sub>O</sub> Output Pins**

These are open-drain outputs. An external pull-up resistor should be added to these pins when in use. If the TSD circuit is activated, Protect is driven Low. When the IC enters the Initial state, M<sub>O</sub> is driven Low.

Pin State	Protect	M <sub>O</sub>
Low	Thermal shutdown	Initial state
High-Z	Normal operation	Other than the initial state

**8. Adjusting the External Capacitor Value (C<sub>OSC</sub>) and Minimum Clock Pulse Width (t<sub>W(CLK)</sub>)**

A triangular-wave is generated internally by CR oscillation. The capacitor is externally connected to the OSC pin. The recommended capacitor value is between 100 pF and 1000 pF.

$$\text{Approximate equation: } f_{OSC} = 1 / \{ C_{OSC} \times 1.5 \times (10 / C_{OSC} + 1) / 66 \} \times 1000 \text{ kHz}$$

(Since this is an approximation formula, the calculation result may not be exactly equal to the actual value.)

The approximate values are shown below.

The minimum clock pulse width (t<sub>W(CLK)</sub>) corresponds to the external capacitor (C<sub>OSC</sub>) as follows:

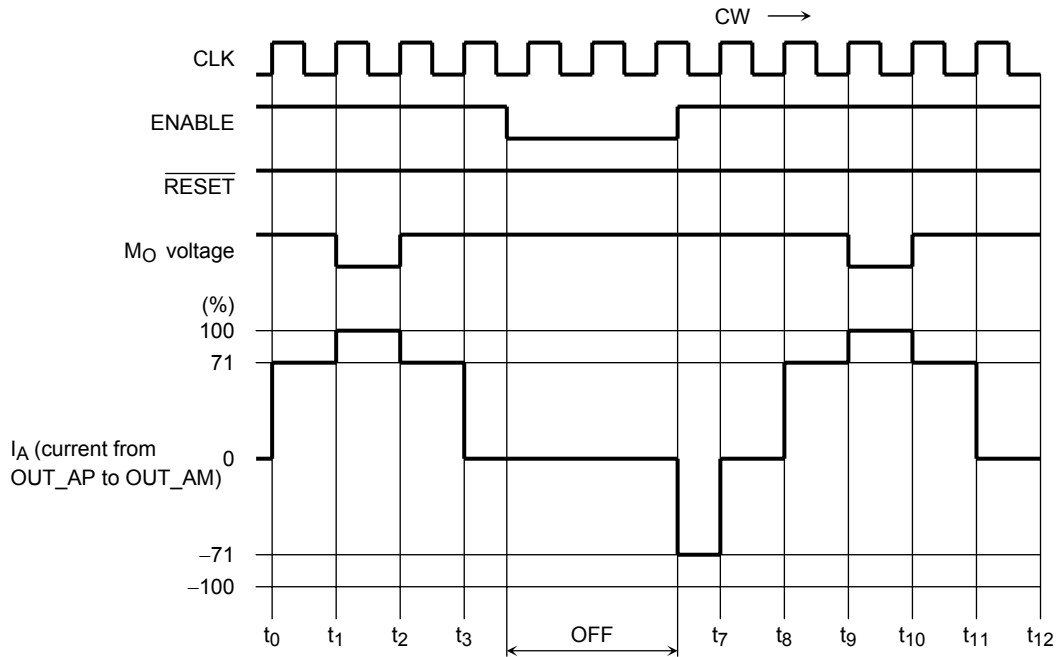

Capacitor	Oscillating Frequency	Minimum Clock Pulse Width t <sub>W(CLK)</sub> (Note 1)
1000 pF	44 kHz	90 μs (Note 2)
330 pF	130 kHz	30 μs
100 pF	400 kHz	10 μs (Note 2)

Note 1: When the frequency of an input clock signal is high, the C<sub>OSC</sub> value should be small so that the duty cycle of an input clock pulse does not become extremely high (should be around 50% or lower).

Note 2: Not tested in production.

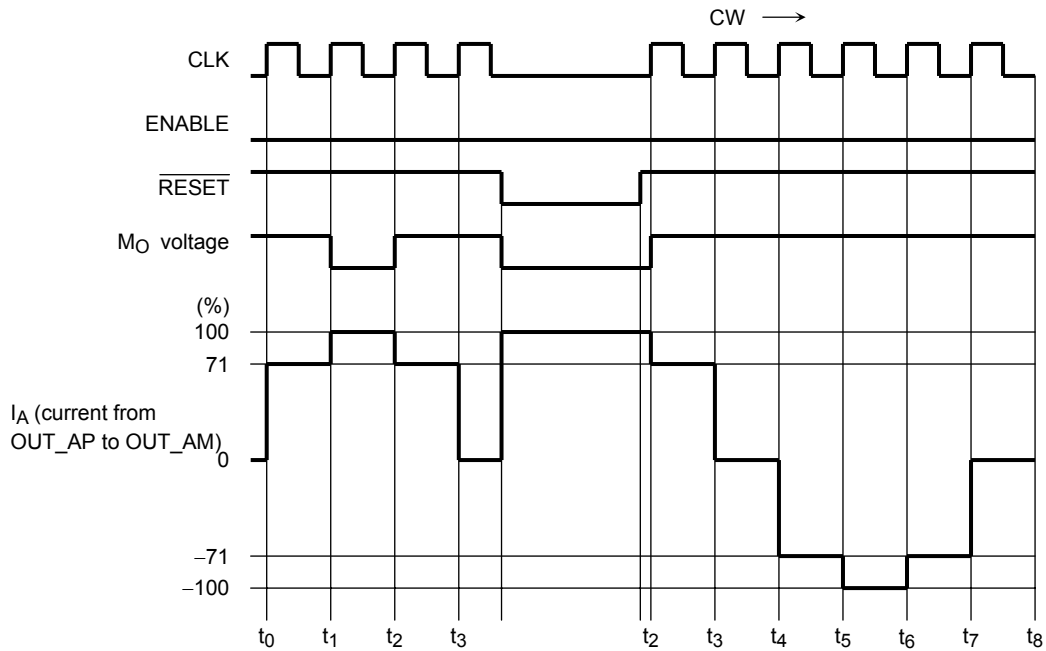

Relationship Between the Enable and  $\overline{\text{RESET}}$  Inputs and Output Signals

**Example 1: ENABLE input in 1-2-phase excitation mode (M1: H, M2: L)**

Setting the ENABLE signal Low disables only the output signals, while internal circuitry other than the output block continues to operate in accordance with the CLK input. Therefore, when the ENABLE signal goes High again, the output current generation is restarted as if phases proceeded with the CLK signal.

**Example 2:  $\overline{\text{RESET}}$  input in 1-2-phase excitation mode (M1: H, M2: L)**

Setting the  $\overline{\text{RESET}}$  signal Low causes the outputs to be put in the Initial state and the  $M_O$  output to be driven Low (Initial state: A-channel output current is at its peak (100%)).

When the  $\overline{\text{RESET}}$  signal goes High again, the output current generation is restarted at the next rising edge of CLK with the state following the Initial state.

**2-Phase Excitation (M1: L, M2: L, CW Mode)**

**1-2-Phase Excitation (M1: H, M2: L, CW Mode)**

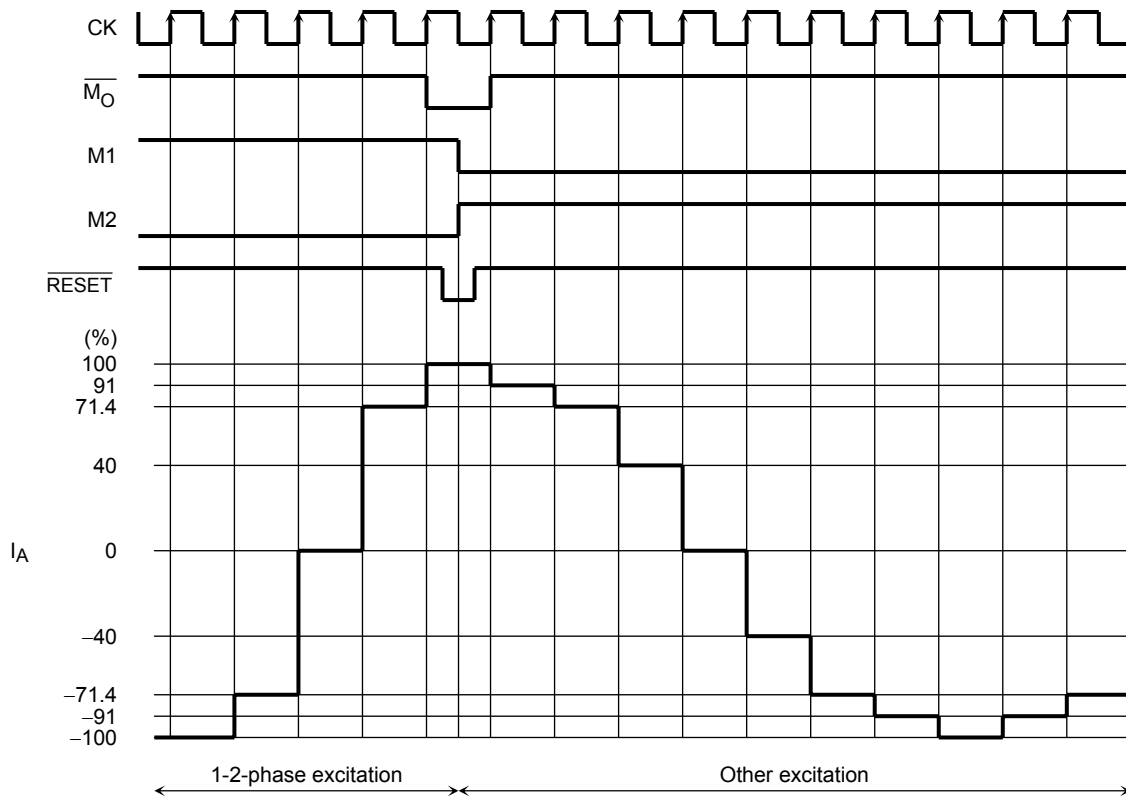

4W1-2-Phase Excitation (M1: L, M2: H, CW Mode)

2W1-2-Phase Excitation (M1: H, M2: H, CW Mode)

<Input Signal Example>

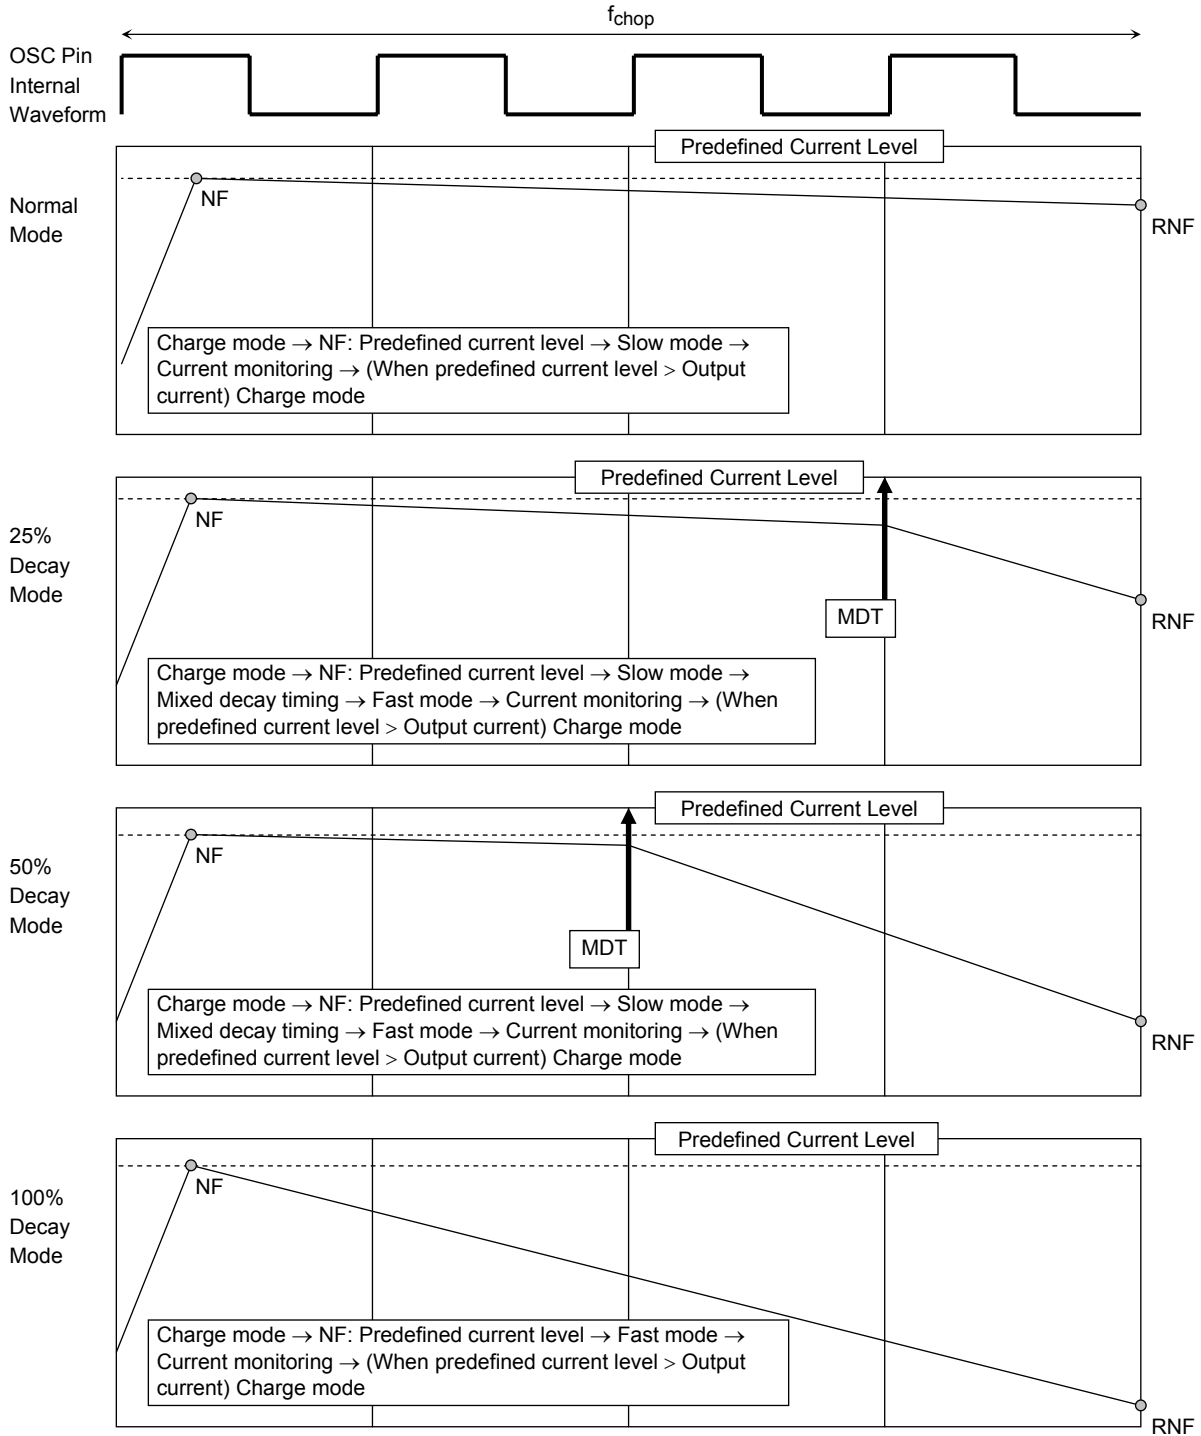

It is recommended that the state of the M1 and M2 pins be changed after setting the  $\overline{\text{RESET}}$  signal Low during the Initial state ( $M_0 = \text{Low}$ ). Even when the  $M_0$  signal is Low, changing the M1 and M2 signals without setting the  $\overline{\text{RESET}}$  signal Low may cause a discontinuity in the current waveform.

**9. Current Waveforms and Mixed Decay Mode Settings**

The current decay rate of the Decay mode operation can be determined by the DCY1 and DCY2 inputs for constant-current control.

The “NF” refers to the point at which the output current reaches its predefined current level, and the “RNF” refers to the monitoring timing of the predefined current.

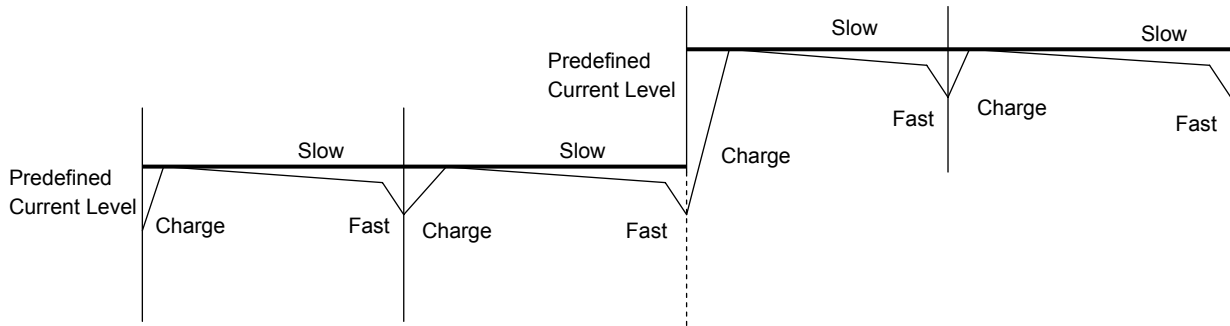

The smaller the MDT value, the smaller the current ripple amplitude. However, the current decay rate decreases.

**10. Current Control Modes (Effects of Decay Modes)**

- Increasing the current (sine wave)

- Decreasing the current with a high decay rate (The current decay rate in Mixed Decay mode is the ratio between the time in Fast-Decay mode (discharge time after MDT) and the remainder of the period.)

- Decreasing the current with a low decay rate (The current decay rate in Mixed Decay mode is the ratio between the time in Fast-Decay mode (discharge time after MDT) and the remainder of the period.)

During Mixed Decay and Fast Decay modes, if the predefined current level is less than the output current at the RNF (current monitoring point), the Charge mode in the next chopping cycle will disappear (though the current control mode is briefly switched to Charge mode in actual operations for current sensing) and the current is controlled in Slow and Fast Decay modes (mode switching from Slow Decay mode to Fast Decay mode at the MDT point).

Note: The above figures are rough illustration of the output current. In actual current waveforms, transient response curves can be observed.

**11. Current Waveforms in Mixed Decay Mode**

- When the NF points come after Mixed Decay Timing points

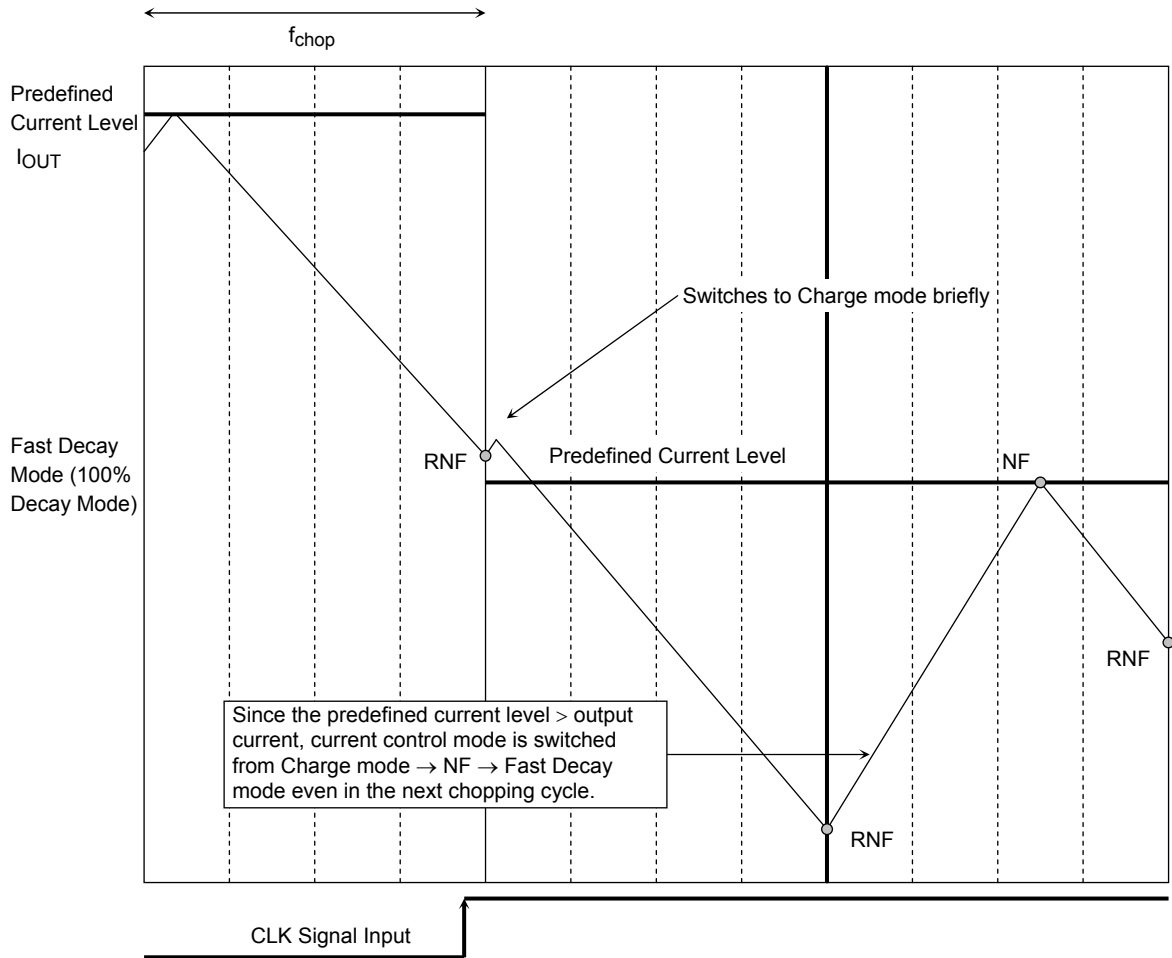

- When the output current value > predefined current level in Mixed Decay mode

\*: Even if the output current rises above the predefined current at the RNF point, the current control mode is briefly switched to Charge mode for current sensing.

**12. Current Waveform in Fast Decay Mode**

After the output current to the load reaches the current value specified by RNF, torque or other means, the output current to the load will be fed back to the power supply fully in Fast Decay mode.

**13. CLK and Internal OSC Signals and Output Current Waveform  
(when the CLK signal is asserted during Slow Decay mode)**

When the CLK signal is asserted, the Chopping Counter (OSC Counter) is forced to reset at the next rising edge of the OSC signal.

As a result, the response to input data is faster compared to methods in which the counter is not reset.

The delay time that is theoretically determined by the logic circuit is one OSC cycle = 10  $\mu$ s at a 100-kHz chopping rate.

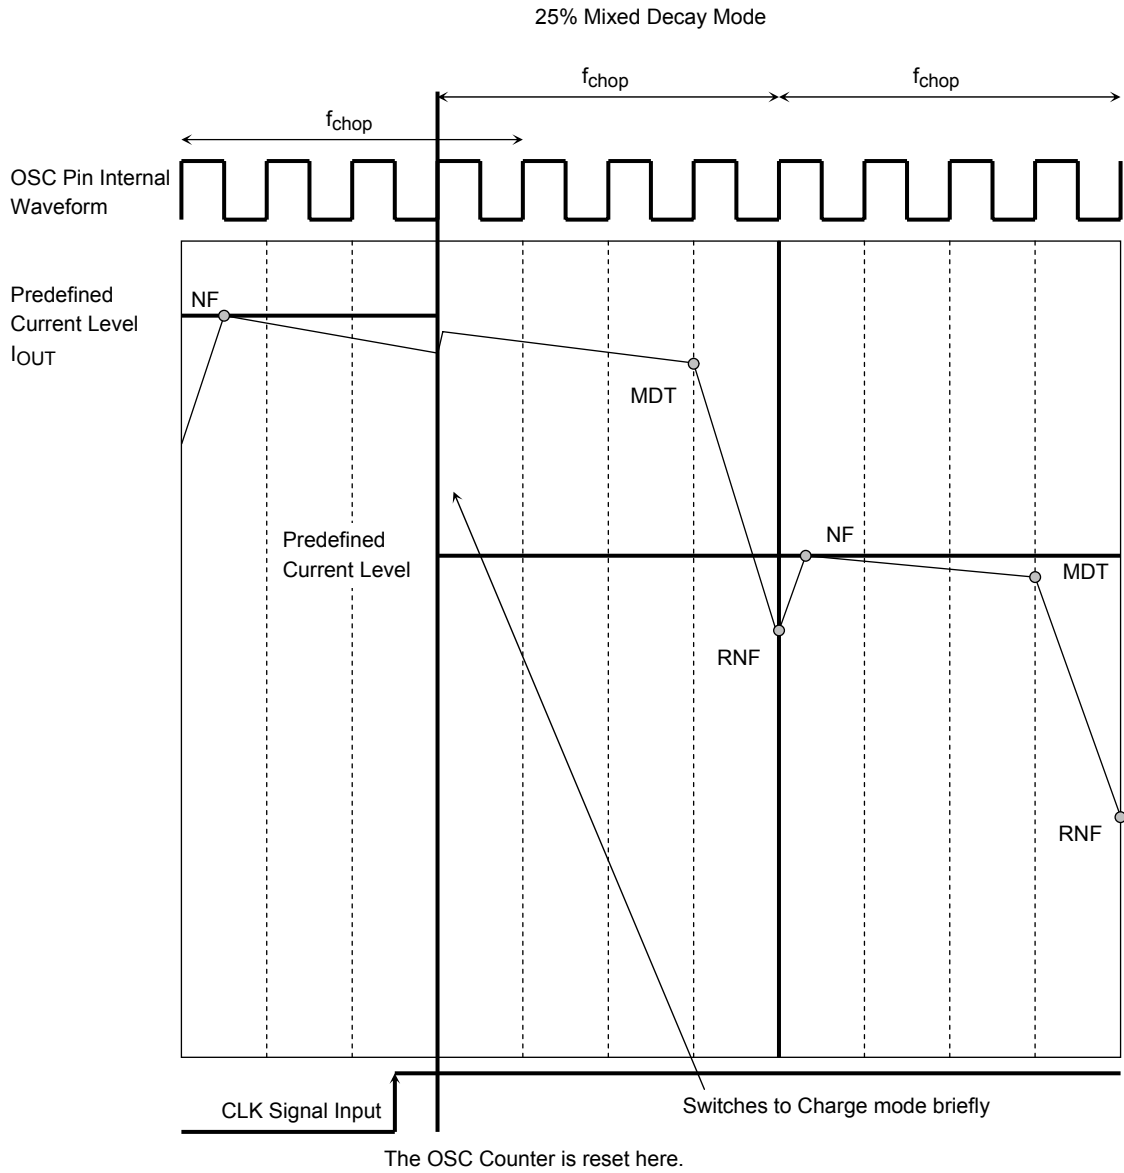

After the OSC Counter is reset by the CLK signal input, the current control mode is invariably switched to Charge mode briefly for current sensing.

**Note:** Even in Fast Decay mode, the current control mode is invariably switched to Charge mode briefly for current sensing.

**14. CLK and Internal OSC Signals and Output Current Waveform  
(when the CLK signal is asserted during Charge mode)**

**15. CLK and Internal OSC Signals and Output Current Waveform  
(when the CLK signal is asserted during Fast Decay mode)**

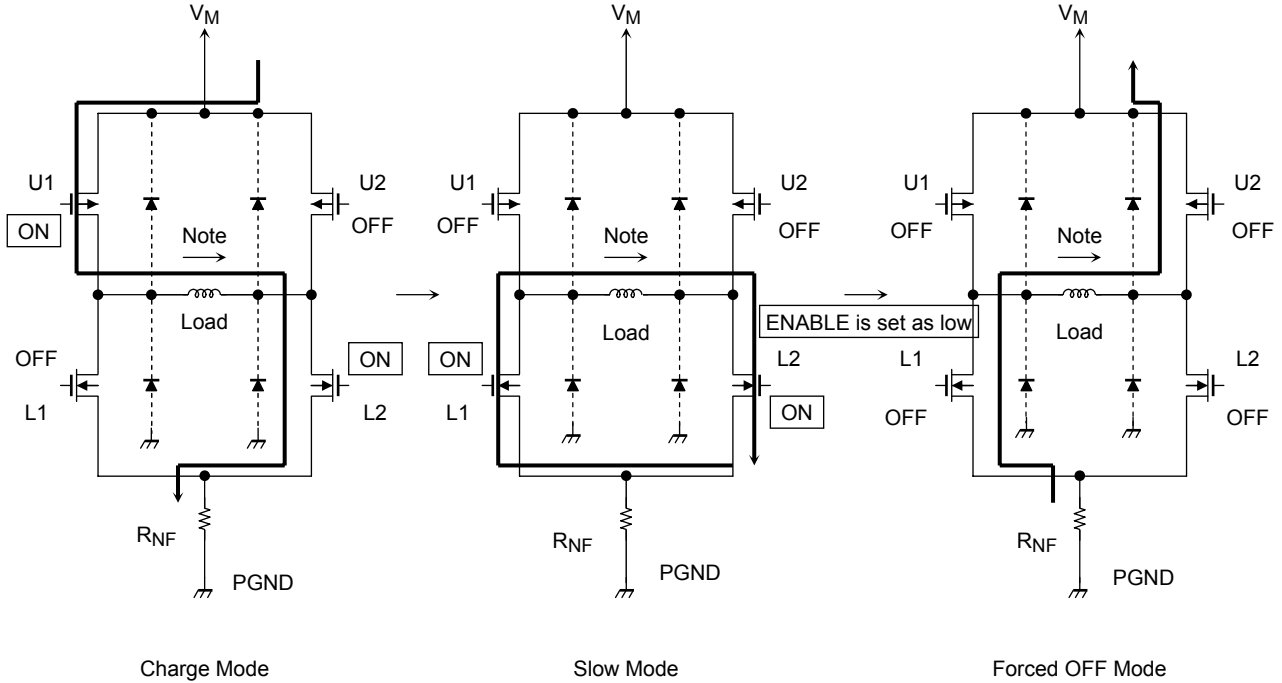

**16. Internal OSC Signal and Output Current Waveform when Predefined Current is Changed from Positive to Negative (when the CLK signal is input using 2-phase excitation)**

**Current Discharge Path when ENABLE is Set as Low During Operation**

When all the output transistors are forced off during Slow Decay mode, the coil energy is discharged in the following modes:

Note: Parasitic diodes are located on dotted lines. However, they are not normally used in normal Mixed Decay mode.

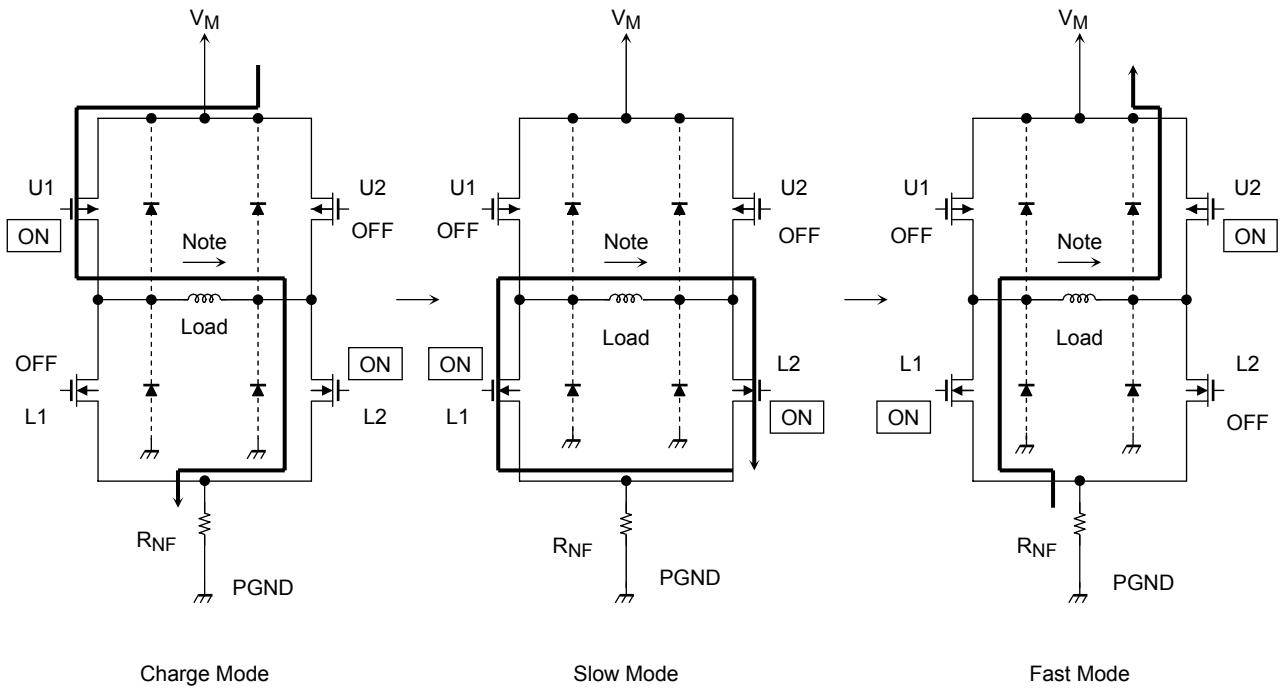

As shown in the figure above, output transistors have parasitic diodes.

Normally, when the energy of the coil is discharged, each transistor is turned on allowing the current to flow in the reverse direction to that in normal operation; as a result, the parasitic diodes are not used. However, when all the output transistors are forced off, the coil energy is discharged via the parasitic diodes.

**Output Transistor Operating Modes**

**Output Transistor Operating Modes**

CLK	U1	U2	L1	L2
Charge	ON	OFF	OFF	ON
Slow Decay	OFF	OFF	ON	ON
Fast Decay	OFF	ON	ON	OFF

Note: This table shows an example of when the current flows as indicated by the arrows in the above figures. If the current flows in the opposite direction, refer to the following table:

CLK	U1	U2	L1	L2
Charge	OFF	ON	ON	OFF
Slow Decay	OFF	OFF	ON	ON
Fast Decay	ON	OFF	OFF	ON

Upon transitions of above-mentioned modes, a dead time of about 300 ns is inserted between each mode respectively.

**Test Points for AC Specifications**

**Figure 1 Timing Waveforms and Symbols**

**OSC-Charge DELAY:**

The OSC waveform is converted into the internal OSC waveform by checking the level of a chopping wave. The internal OSC signal is designed to be logic High when the OSC voltage is at 2 V or above, and to be logic Low when the OSC voltage is at 0.5 V or below. However, there is a response delay and that there occurs a peak-to-peak voltage variation.

**Figure 2 Timing Waveforms (OSC Signal)**

**Power Dissipation**

**TB6560AHQ**

**1. Power-on Sequence with Control Input Signals**

Turn on V<sub>DD</sub>. Then, when the V<sub>DD</sub> voltage has stabilized, turn on V<sub>MA/B</sub>.  
Hold the control input pins Low while turning on V<sub>DD</sub> and V<sub>MA/B</sub>.  
(All the control input pins are internally pulled down.)

After V<sub>DD</sub> and V<sub>MA/B</sub> completely stabilizes at the rated voltages, the  $\overline{\text{RESET}}$  and ENABLE pins can be set High. If this sequence is not properly followed, the IC may not operate correctly, or the IC and the peripheral parts may be damaged.

When  $\overline{\text{RESET}}$  is released High, the CLK signal is applied and excitation is started. Only after ENABLE is also set High, outputs are enabled. When only  $\overline{\text{RESET}}$  is set High, outputs are disabled and only the internal counter advances. Likewise, when only ENABLE is set High, the excitation will not be performed even if the CLK signal is applied and the outputs will remain in the initial state.

An example of a control input sequence is shown below.

A power-off sequence should be the reverse of this sequence.

<Recommended Control Input Sequence>

**2. Power Dissipation**

The power dissipation of the IC can be calculated by the following equation:

$$P = V_{DD} \times I_{DD} + I_{OUT} \times R_{on} \times 2 \text{ drivers}$$

The higher the ambient temperature, the smaller the power dissipation.

Examine the PD-Ta characteristic curve to determine if there is a sufficient margin in the thermal design.

**3. Treatment of Heat-Radiating Fin**

The heat-radiating fin pins of the TB6560AHQ/AFG (backside) are electrically connected to the backside of the die. Thus, if a current flows to the fin, the IC may malfunction. If there is any possibility of a voltage being generated between grounds and the fin, the fin pins should either be connected to ground or insulated.

**4. Thermal Shutdown (TSD)**

When the die temperature reaches 170°C (typ.), the thermal shutdown circuit is tripped, switching the outputs to off. There is a variation of about ±20°C in the temperature at which the thermal shutdown circuit is tripped.

**Package Dimensions**

HZIP25-P-1.27

Unit : mm

Weight: 9.86 g (typ.)

**Package Dimensions**

HQFP64-P-1010-0.50

Unit : mm

Weight: 0.26 g (typ.)

Note: The size of a backside heatsink is 5.5 mm × 5.5 mm. (Preliminary)

## Notes on Contents

### 1. Block Diagrams

Some of the functional blocks, circuits, or constants in the block diagram may be omitted or simplified for explanatory purposes.

### 2. Equivalent Circuits

The equivalent circuit diagrams may be simplified or some parts of them may be omitted for explanatory purposes.

### 3. Timing Charts

Timing charts may be simplified for explanatory purposes.

### 4. Application Circuits

The application circuits shown in this document are provided for reference purposes only. Thorough evaluation is required, especially at the mass production design stage.

Toshiba does not grant any license to any industrial property rights by providing these examples of application circuits.

### 5. Test Circuits

Components in the test circuits are used only to obtain and confirm the device characteristics. These components and circuits are not guaranteed to prevent malfunction or failure from occurring in the application equipment.

## IC Usage Considerations

### Notes on Handling of ICs

- (1) The absolute maximum ratings of a semiconductor device are a set of ratings that must not be exceeded, even for a moment. Do not exceed any of these ratings.  
Exceeding the rating(s) may cause the device breakdown, damage or deterioration, and may result in injury by explosion or combustion.
- (2) Use an appropriate power supply fuse to ensure that a large current does not continuously flow in case of over current and/or IC failure. The IC will fully break down when used under conditions that exceed its absolute maximum ratings, when the wiring is routed improperly or when an abnormal pulse noise occurs from the wiring or load, causing a large current to continuously flow and the breakdown can lead smoke or ignition. To minimize the effects of the flow of a large current in case of breakdown, appropriate settings, such as fuse capacity, fusing time and insertion circuit location, are required.
- (3) If your design includes an inductive load such as a motor coil, incorporate a protection circuit into the design to prevent device malfunction or breakdown caused by the current resulting from the inrush current at power ON or the negative current resulting from the back electromotive force at power OFF. IC breakdown may cause injury, smoke or ignition.  
Use a stable power supply with ICs with built-in protection functions. If the power supply is unstable, the protection function may not operate, causing IC breakdown. IC breakdown may cause injury, smoke or ignition.
- (4) Do not insert devices in the wrong orientation or incorrectly.  
Make sure that the positive and negative terminals of power supplies are connected properly. Otherwise, the current or power consumption may exceed the absolute maximum rating, and exceeding the rating(s) may cause the device breakdown, damage or deterioration, and may result in injury by explosion or combustion.  
In addition, do not use any device that is applied the current with inserting in the wrong orientation or incorrectly even just one time.

## Points to Remember on Handling of ICs

(1) Thermal Shutdown Circuit

Thermal shutdown circuits do not necessarily protect ICs under all circumstances. If the thermal shutdown circuits operate against the over temperature, clear the heat generation status immediately.

Depending on the method of use and usage conditions, such as exceeding absolute maximum ratings can cause the thermal shutdown circuit to not operate properly or IC breakdown before operation.

(2) Heat Radiation Design

In using an IC with large current flow such as power amp, regulator or driver, please design the device so that heat is appropriately radiated, not to exceed the specified junction temperature ( $T_J$ ) at any time and condition. These ICs generate heat even during normal use. An inadequate IC heat radiation design can lead to decrease in IC life, deterioration of IC characteristics or IC breakdown. In addition, please design the device taking into consideration the effect of IC heat radiation with peripheral components.

(3) Back-EMF

When a motor rotates in the reverse direction, stops or slows down abruptly, a current flow back to the motor's power supply due to the effect of back-EMF. If the current sink capability of the power supply is small, the device's motor power supply and output pins might be exposed to conditions beyond maximum ratings. To avoid this problem, take the effect of back-EMF into consideration in system design.

(4) Short-Circuits

The IC may be permanently damaged in case of a short-circuit across its outputs, a short-circuit to power supply or a short-circuit to ground. These possibilities should be fully considered in the design of the output, VDD, VM and ground lines.

(5) Short-Circuits between Adjacent Pins in the TB6560AHQ

In the TB6560AHQ, the term "adjacent pin" includes a pin diagonally closest to a given pin. For example, pin 3 has four adjacent pins: 1, 2, 4 and 5.

Depending on the specified voltage and current, a large current might abruptly flow through the TB6560AHQ in case of a short-circuit between any adjacent pins that are listed below. If the large current persists, it may lead to a smoke emission.

- 1) Pins 7 and 8
- 2) Pins 7 and 9
- 3) Pins 8 and 9
- 4) Pins 9 and 10
- 5) Pins 9 and 11
- 6) Pins 10 and 12
- 7) Pins 11 and 12
- 8) Pins 11 and 13
- 9) Pins 12 and 13
- 10) Pins 12 and 14
- 11) Pins 13 and 14
- 12) Pins 13 and 15
- 13) Pins 14 and 16
- 14) Pins 15 and 16
- 15) Pins 16 and 17
- 16) Pins 16 and 18
- 17) Pins 17 and 18
- 18) Pins 18 and 19
- 19) Pins 18 and 20

Therefore, to avoid a continuous overcurrent due to the above-described short-circuit and allow the TB6560AHQ/AFG to be fail-safe, an appropriate fuse should be added at the right place, or overcurrent shutdown circuitry should be added to the power supply. The rated current of a fuse may vary depending on actual applications and its characteristics. Thus, an appropriate fuse must be selected experimentally.

About solderability, following conditions were confirmed

- Solderability
  - (1) Use of Sn-37Pb solder Bath
    - solder bath temperature = 230°C
    - dipping time = 5 seconds
    - the number of times = once
    - use of R-type flux
  - (2) Use of Sn-3.0Ag-0.5Cu solder Bath
    - solder bath temperature = 245°C
    - dipping time = 5 seconds
    - the number of times = once
    - use of R-type flux

## RESTRICTIONS ON PRODUCT USE

070122EBA\_R6

- The information contained herein is subject to change without notice. 021023\_D
- TOSHIBA is continually working to improve the quality and reliability of its products. Nevertheless, semiconductor devices in general can malfunction or fail due to their inherent electrical sensitivity and vulnerability to physical stress. It is the responsibility of the buyer, when utilizing TOSHIBA products, to comply with the standards of safety in making a safe design for the entire system, and to avoid situations in which a malfunction or failure of such TOSHIBA products could cause loss of human life, bodily injury or damage to property.  
In developing your designs, please ensure that TOSHIBA products are used within specified operating ranges as set forth in the most recent TOSHIBA products specifications. Also, please keep in mind the precautions and conditions set forth in the "Handling Guide for Semiconductor Devices," or "TOSHIBA Semiconductor Reliability Handbook" etc. 021023\_A
- The TOSHIBA products listed in this document are intended for usage in general electronics applications (computer, personal equipment, office equipment, measuring equipment, industrial robotics, domestic appliances, etc.). These TOSHIBA products are neither intended nor warranted for usage in equipment that requires extraordinarily high quality and/or reliability or a malfunction or failure of which may cause loss of human life or bodily injury ("Unintended Usage"). Unintended Usage include atomic energy control instruments, airplane or spaceship instruments, transportation instruments, traffic signal instruments, combustion control instruments, medical instruments, all types of safety devices, etc. Unintended Usage of TOSHIBA products listed in this document shall be made at the customer's own risk. 021023\_B
- The products described in this document shall not be used or embedded to any downstream products of which manufacture, use and/or sale are prohibited under any applicable laws and regulations. 060106\_Q
- The information contained herein is presented only as a guide for the applications of our products. No responsibility is assumed by TOSHIBA for any infringements of patents or other rights of the third parties which may result from its use. No license is granted by implication or otherwise under any patents or other rights of TOSHIBA or the third parties. 070122\_C
- Please use this product in compliance with all applicable laws and regulations that regulate the inclusion or use of controlled substances.  
Toshiba assumes no liability for damage or losses occurring as a result of noncompliance with applicable laws and regulations. 060819\_AF
- The products described in this document are subject to foreign exchange and foreign trade control laws. 060925\_E
